## SUMMARY

Software Developer with 3+ years of experience building scalable web and mobile applications using Java, Spring Boot, React, TypeScript, and Flutter. Experienced in designing REST APIs, real-time systems, and full-stack applications, including GPS tracking platforms, analytics dashboards, and cross-platform mobile apps. Skilled in system design, performance optimization, Docker-based deployments, and CI/CD automation. Passionate about AI-assisted software engineering, actively building MCP-based workflows and leveraging modern LLM tools to improve developer productivity.

## TECHNICAL SKILLS

**Frontend:** React, TypeScript, JavaScript (ES6+) Next.js, Redux, TanStack Router, HTML5, CSS3, Tailwind CSS, Chakra UI, shadcn/ui, Web Workers, WebSockets

**Backend:** Java, Spring Boot, Python, Node.js, WebSockets

**Mobile:** Kotlin, Flutter, Google Maps SDK

**Databases:** PostgreSQL, MongoDB, MySQL

**DevOps & Tools:** Docker, Nginx, Redis, Ubuntu Server, GitHub Actions CI/CD

**AI & MCP:** Claude Code, MCP server development, prompt engineering

**Testing:** Jest, React Testing Library

## EXPERIENCE

### Software Engineer

Primesys Technologies LLP

Sep 2023 – Present

Pune, India

- Migrated a legacy Angular application to React using TanStack file-based routing, lazy loading, and modular architecture, improving type safety, maintainability, and component reuse.
- Optimized frontend performance by reducing redundant API calls and re-renders with useMemo/useCallback, leveraging Web Workers for background processing, and implementing WebSocket-based real-time location tracking with client-side caching.
- Built an internal Admin Dashboard from scratch using React, Chakra UI, and shadcn/ui, delivering interactive analytics and streamlining operational workflows.
- Architected a real-time reporting system in Spring Boot using ExecutorService and multithreading, replacing cron jobs to support 2,000+ devices and reducing report generation time by 60% (1m 45s → 35s for 300 devices); also developed GPS trip detection, optimized database queries, and implemented REST APIs with report versioning and audit logging.
- Developed cross-platform mobile applications in React Native and Flutter, led migration to Flutter to resolve Google Maps performance issues, and built MCP servers with the Anthropic MCP SDK to expose internal APIs as AI-agent tools.

Java, SpringBoot, Monolithic Service

## EDUCATION

### Bachelor of Technology — Mechanical Engineering

JIS University

2019 – 2023

Kolkata, India

## PROJECTS

---

### **Backend Admin API Service** | *Java, Spring Boot, Monolithic Service, Multi-Threading*

*Jul 2024 – Present*

*Backend, Primesys Technologies*

- Architected a real-time on-demand reporting system with Spring Boot, replacing scheduled cron jobs and scaling instant report delivery to 2,000+ devices; leveraged ExecutorService with fixed-size threadpools for concurrent processing, cutting report generation time by 60% from 1m 45s down to 35s for 300 devices across 9+ hours of trip data.
- Built a custom trip detection engine using Java collections and business logic to accurately identify valid directional movement patterns; optimized database queries and indexing strategies that directly improved reporting throughput and system scalability under high data loads.
- Developed and refactored REST APIs across the full stack and designed a report versioning and audit logging framework to maintain historical snapshots ensuring full traceability and compliance for all generated reports.
- Contributed to microservices architecture and system design discussions, enforced code quality through structured code reviews, and led API integration efforts between internal backend services and third-party systems improving cross-team delivery consistency and reducing integration friction.

### **Resume Builder** | *NestJs, Tanstack React, Shadcn, Tailwind Css*

*Jun 2026 – Jul 2026*

*resumeio.codymitra.com*

- Designed to create multiple format of resume and specially to avoid word and paid resume websites.
- Used Claude Code in certain sections like import, export pdf and theme palette.
- Future Scope of this project is create portfolios from resume and any one can host their portfolio using domain codymitra.com and AI Interview preparation according to their resume.

### **AI-Assisted Development & MCP Integration**

*Jun 2026 – Jul 2026*

*MCP, Anthropic, Claude Code, LLM*

- Built custom MCP (Model Context Protocol) servers using the Anthropic MCP SDK to expose internal APIs and business logic as callable tools for AI agents, enabling AI models to interact directly with backend services.
- Integrated Claude Code into the daily development workflow for accelerated code generation, boilerplate scaffolding, and refactoring complex logic, reducing implementation time on repetitive tasks.

### **OPD (Outpatient Department)** | *React, NestJs, Tailwind CSS, PostgreSQL, FreeBuff*

*Jun 2026 – Present*

*opd.codymitra.com*

- Clinic/Pharmacy ERP System — Architected and built a full-stack healthcare ERP from scratch, covering patient registration, appointment scheduling, live queue management, doctor consultations, e-prescriptions, and pharmacy/billing POS.
- Engineered a unified NestJS + Prisma/PostgreSQL backend with JWT auth and role-based data scoping (e.g., doctors server-side restricted to their own patient records), replacing a prior dual-service architecture.
- Built a type-safe React frontend (TanStack Router, Redux Toolkit, Tailwind v4, shadcn/ui, Zod validation) with distinct role-driven layouts and routing for receptionists, doctors, and POS staff.
- Designed core clinical workflows end-to-end, including the appointment-to-queue state machine (check-in triggers queueing, not booking) and document/prescription management.
- Built using AI assisted tooling like Claude and FreeBuff and with self research of market.

### **Mobile Development** – | *Kotlin*

- Developed cross-platform mobile applications using Kotlin, delivering responsive experiences across Android and iOS, identified animation performance bottlenecks, and optimized Google Maps marker animations to enable smooth real-time movement visualization.
- Implemented push notifications and real-time data integrations to keep users informed of critical events, status updates, and location-based activities.
- Integrated an AI-powered chatbot within the mobile app, improving user engagement, enabling self-service support, and providing faster access to information and actions.
